

Type 2 Diabetes Remission; Internist Perspective

Kusuma Chaiyasoot MD, PhD, MRCP(Lond) Division of Nutrition, Department of Medicine, Faculty of Medicine Siriraj Hospital, Mahidol University, Bangkok, Thailand

Agenda

- Pathophysiology of T2DM 'old and new concepts'
- Definition of T2DM remission
- Landmark studies
- Differences between Asians and Caucasians in terms of T2DM
- Studies of T2DM remission in Asians
- Who will get the remission?
- How to get the remission?

DeFronzo R.A. Diabetes 2009; 58(4): 773-95

American Diabetes Association

Definition of T2D remission

- HbA1c <6.5% (48 mmol/mol)
- Remains at that level for at least 3 months
- Without continuation of the usual anti-hyperglycaemic agents

Table 1-Interventions and temporal factors in determining remission of T2D

Intervention Note: Documentation of remission should include a measurement of HbA _{1c} just prior to intervention	Interval before testing of HbA _{1c} can reliably evaluate the response	Subsequent measurements of HbA _{1c} to document continuation of a remission
Pharmacotherapy	At least 3 months after cessation of this intervention	Not more often than every 3 months nor less frequent than yearly
Surgery	At least 3 months after the procedure and 3 months after cessation of any pharmacotherapy	
Lifestyle	At least 6 months after beginning this intervention <i>and</i> 3 months after cessation of any pharmacotherapy	

The Look AHEAD Study

- 5,145 overweight or obese patients with type 2 diabetes
- An intensive lifestyle intervention (intervention group) or to receive diabetes support and education (control group)
- Median follow-up was 9.6 years
- Weight loss was greater in the intervention group than in the control group

throughout the study

- 8.6% vs. 0.7% at 1 year
- 6.0% vs. 3.5% at study end

T2D remission rate in intervention group

- 11.5% at 1 year
- 7.3% at 4 years
- Modest weight loss achieved
- Wide range of T2D duration

The Diabetes Remission Clinical Trial (DiRECT)

- 49 primary care practices in Scotland
- Weight management programme (intervention) or best-practice care by guidelines (control)
 - Individuals aged 20–65 years
 - Diagnosed with T2D within the past 6 years
 - BMI of 27-45 kg/m²
 - Not receiving insulin

	Intervention group (n=149)	Control group (n=149)		
Sex				
Female	66 (44%)	56 (38%)		
Male	83 (56%)	93 (62%)		
White ethnicity	146 (98%)	147 (99%)		
Age (years)	52.9 (7.6)	55.9 (7.3)		
Weight (kg)	101.0 (16.7)	98.8 (16.1)		
Body-mass index (kg/m²)	35.1 (4.5)	34.2 (4.3)		
Waist (cm)	107.5 (8.4)	106.5 (8.9)		
Systolic blood pressure (mm Hg)	132.7 (17.5)	137-2 (16-0)		
Diastolic blood pressure (mm Hg)	84.6 (10.2)	85.5 (8.8)		
Time since diabetes diagnosis (year	rs)			
Mean (SD)	3.0 (1.7)	3.0 (1.8)		
Median (range)	3.1 (0.0-6.0)	2.6 (0.2-6.0)		
HbA _{ac}				
%	7.7 (1.25)	7.5 (1.05)		
mmol/mol	60 (1 3·7)	58 (11·5)		
Fasting glucose (mmol/L)	9.22 (3.29)	8.82 (2.54)		
and a second sec	Lean M.E.J. et al. La	ancet 2018: 391: 54

Lean M.E.J. et al. Lancet 2018; 391: 541–51

T2D remission rateAt 1 year: 46%At 2 years: 36%

Figure 2: Primary outcomes and remission of diabetes in relation to weight loss at 12 months

(A) First co-primary outcome: achievement of at least 15 kg weight loss at 12 months. (B) Second co-primary outcome: remission of diabetes (glycated haemoglobin <6.5% [48mmol/mol], off antidiabetic medication for 2 months). (C) Remission of diabetes, in relation to weight loss achieved at 12 months (both groups combined).

What Asians differ from Caucasians in terms of T2DM?

Pathophysiology, phenotypes and management of type 2 diabetes mellitus in Indian and Chinese populations

Calvin Ke $\mathbb{D}^{1,2,3,4,5}$, K. M. Venkat Narayan $\mathbb{D}^{6,7,8}$, Juliana C. N. Chan $\mathbb{D}^{4,5,9,10}$, Prabhat Jha³ and Baiju R. Shah^{1,11}

- India and China account for nearly half of the global number of people with T2DM
- Compared with European people, Indian and Chinese people seem to be:
 - Generally younger ages at diagnosis
 - Lower β -cell function
 - Lower insulin resistance
 - Lower BMI

ANNALS OF THE NEW YORK ACADEMY OF SCIENCES Issue: The Year in Diabetes and Obesity

Type 2 diabetes in East Asians: similarities and differences with populations in Europe and the United States

Ronald C.W. Ma and Juliana C.N. Chan

Figure 1. Relationship between BMI and diabetes prevalence in different ethnicities from the DECODA Study compared to a European population.³⁷ Adapted with permission.

 East Asians develop T2DM at much lower BMI than Caucasians

- Obesity associated T2DM risk
 - a 2.5- to 3-fold in Asians

A 6- to 8-fold in a U.S.
 population

- Younger onset (3 years lower)
- Beta-cell dysfunction
- Visceral fat

binar

- More insulin resistance
- White rice consumption

Ann. N.Y. Acad. Sci. 1281 (2013) 64–91

White rice consumption and risk of type 2 diabetes: meta-analysis and systematic review

© 00 OPEN ACCESS

Emily A Hu research assistant¹, An Pan research fellow¹, Vasanti Malik research fellow¹, Qi Sun instructor in medicine¹²

White rice consumption:

- Asians: 3 4 servings/day
- Western: 1 2 servings/week

The pooled relative risk:

- Asians: 1.55 (95% CI 1.20 2.01)
- Western: 1.12 (0.94 1.33)

Fig 2 Pooled random effects relative risk (95% CI) of type 2 diabetes comparing high with low white rice consumption levels. P values are P for heterogeneity

White rice consumption and risk of type 2 diabetes: meta-analysis and systematic review

OPEN ACCESS

What Asians differ from Caucasians in terms of T2DM?

• Younger ages at diagnosis

Dietary pattern

- Lower BMI
- More impaired β-cell function
- Different fat distribution
 - Higher visceral fat

- Lower energy
- Higher CHO consumption
 - White rice
- Lower protein

Effect of intensive lifestyle intervention on bodyweight and glycaemia in early type 2 diabetes (DIADEM-I): an open-label, parallel-group, randomised controlled trial

18 – 50 years, Middle East and north Africa region Diabetes duration ≤3 years (mean 21 months) BMI ≥27 kg/m² (mean 35 kg/m²)

Intensive lifestyle intervention

- A 12-week total diet replacement phase (800 kcal/day)
- Followed by a 12-week food reintroduction phase
- All diabetes medications were discontinued

study

Diabetes remission after a lifestyle-medicine intervention on type 2 diabetes in lean and obese Chinese subjects: a prospective

Wenying Zou^{1#}[^], Kunyuan Luo^{2#}, Zhiyong Hu¹, Xiongchou Zhang², Cuiping Feng², Dingkang Ye², Shenghao Liu², Qiwei Zhang³, Rongshao Tan⁴, Chengbin Fu^{2,5}[^]

<20 years after T2DM diagnosis</p>
≥6 months treatment with oral anti-diabetic drugs without serious complications no history of insulin use.

Lifestyle-medicine intervention

- Withdrawal of anti-diabetic drugs
- <u>1st month</u>, a low-carbohydrate diet
 (35–40% carbohydrate, 20–30% protein, and 30–45% fat);
 - **1,800** kcal/day for the lean group
 - 700–900 kcal/day for the obese group
- <u>2nd 6th month</u>, stepped normal construction diet
 50–55% carbohydrate, 15–20% protein, and
 20–30% fat; **30–35 kcal/kg/day**

Macronutrient Recommendations for Remission and Prevention of Diabetes in Asian Indians Based on a Data-Driven Optimization Model: The ICMR-INDIAB National Study

Diabetes Care 2022;45:2883–2891 | https://doi.org/10.2337/dc22-0627

The national Acceptable Macronutrient Distribution Range (AMDR) for adults:

- Carbohydrates 45–65% of total calories
- Protein 5–15%
- Fat 15–35%

For remission/prevention of T2D

- A lower range of carbohydrate intake (49–56%E)
- A higher range of protein (14–20%E)
- A narrower range of fat intake (21–27%E)

Who will get T2DM remission?

How to get T2DM remission?

Thank you very much.
